

**ABSTRACT OF THE DISCLOSURE**

A paper cassette holds a stack of print medium therein. A guide member includes first and second members. A medium-supporting plate supports the stack of the paper placed thereon. When the guide member is moved to a predetermined position, the first member abuts the end of the stack of print medium and the second member slides under the edges of the paper placed on the medium-supporting plate. The second member has a tapered forward end portion that allows the second member to smoothly slide under the bottom of the stack of print medium. The guide member is guided in a groove to move to and from the stack of print medium. The second member has a flat portion and the tapered forward end portion extends further away from the flat portion than the bottom of the stack of print medium.
